DETAILED ACTION

1. In view of the pre-appeal request filed on 12/04/2008, PROSECUTION IS HEREBY REOPENED. New grounds of rejection are set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

- (1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,
- (2) initiate a new appeal by filing a notice of appeal under 37 CFR 41.31 followed by an appeal brief under 37 CFR 41.37. The previously paid notice of appeal fee and appeal brief fee can be applied to the new appeal. If, however, the appeal fees set forth in 37 CFR 41.20 have been increased since they were previously paid, then appellant must pay the difference between the increased fees and the amount previously paid.

A Supervisory Patent Examiner (SPE) has approved of reopening prosecution by signing below.

Claim Rejections - 35 USC § 103

2. Claims 1-5, 14-20, 26-30 and 39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevens, ("TCP/IP Illustrated, Volume 1"), and further in view of Aweya et al., (US Patent No. 7,047,312), (hereinafter Aweya).

Regarding claims 1, 15 and 26, Stevens discloses establishing an active connection adapted to send packets of data between a host and a destination [Stevens, chapter 20, figure 20.1, step 1];

receiving from the destination a first window value representing a first quantity of data packets [Stevens, chapter 20, figure 20.1, step 2];

sending packets of data from said host to said destination [Stevens, chapter 20, figure 20.1, steps 4-6];

receiving an acknowledgment from said destination for each packet of data received by said destination wherein said first window value represents a limit imposed on said host by said destination on the quantity of data packets sent from said host to said destination and lacking an acknowledgment of being received by destination [Stevens, chapter 20, figure 20.1, steps 7-8]; and

limiting the number of packets sent by said host [Stevens, chapter 20, figure 20.1, step 8], but not acknowledged as received by said destination, to a second quantity of data packets less than said first window value wherein said second quantity represents a limit imposed by said host on the quantity of data packets sent from said host to said destination and lacking an acknowledgment of being received by destination [Stevens, chapter 20, figure 20.1, steps 7-8].

Stevens does not specifically disclose wherein said second quantity is a function of the number of active connections of the host.

However, Aweya in the same field of endeavor discloses reducing the sliding window based on the congestion related to the number of active connections [Aweya, column 6, lines 20-29].

It would have been obvious to one having ordinary skill in the art at the time the invention was made to include the number of active connections in order to allow the target machine to update the sliding window based on all packets being received.

Regarding claims 2, 17 and 27, Stevens-Aweya further discloses wherein the connection is a Transmission Control Protocol connection between the host and the destination [Stevens, Chapter 20, page 275, Introduction] and wherein said first window value is a Transmission Control Protocol send window value [Stevens, chapter 20, figure 20.1, steps 1-3].

Regarding claims 3, 18 and 28, Stevens-Aweya further discloses establishing a plurality of active connections between the host and a plurality of destinations [Aweya, column 6, lines 30-36];

receiving from each destination a first window value representing a first quantity of data packets for the connection [Stevens, chapter 20, figure 20.1, steps 1-3]; sending packets of data from said host to each destination [Stevens, chapter 20, figure 20.1, steps 4-6];

receiving an acknowledgment from each destination for each packet of data received by each destination [Stevens, chapter 20, figure 20.1, steps 4-16] wherein the first window value of each connection represents a limit imposed on said host by the destination of the connection on the quantity of data packets sent from said host to the destination of the connection and lacking an acknowledgment of being received by the destination of the connection [Stevens, chapter 20, figure 20.1, steps 7-8]; and limiting the number of packets sent by said host to each connection, but not acknowledged as received by the destination of each connection, to a second quantity of data packets less than the window value of the connection [Stevens, chapter 20, figure 20.1, steps 7-8];

wherein the second quantity of each connection which is less than the window value of the connection is based, at least in part, on the number of active connections of the host [Aweya, column 6, lines 20-29].

Regarding claims 4, 19 and 29, Stevens-Aweya further discloses wherein said host has a plurality of Transmission Control Protocol connections [Aweya, column 6, lines 9-19], each Transmission Control Protocol connection having a Protocol Control Block which stores a Transmission Control Protocol send window value and a virtual window value less than said Transmission Control Protocol send window value [Aweya, column 6, lines 9-19] wherein each virtual window value limits the number of packets sent by said host, but not acknowledged as received by the destination of each Transmission Control Protocol connection, to a second quantity of data packets defined by the virtual window

value of the Transmission Control Protocol connection [Aweya, column 6, lines 20-29].

Regarding claims 5, 20 and 30, Stevens-Aweya further discloses in response to the destination reducing the size of the Transmission Control Protocol send window value to a third quantity less than the second quantity, limiting the number of packets sent by said host, but not acknowledged as received by said destination, to a fourth quantity of data packets no greater than the reduced size of the Transmission Control Protocol send window value [Stevens, chapter 20, figure 20.1, steps 1-10].

Regarding claims 14 and 39, Stevens-Aweya further discloses changing the size of the second quantity of packets limiting the number of packets sent by the host but not acknowledged as received by the destination prior to sending at least one packet [Stevens, chapter 20, figure 20.1, steps 1-10].

Regarding claim 16, Stevens-Aweya further discloses the data storage comprises a magnetic storage medium [Aweya, column 6, lines 20-29].

3. Claims 6-13, 21-25 and 31-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stevens-Aweya as applied to claims 1, 15 and 26 above, and further in view of Boyd et al., (US Publication No. 2004/0049580), (hereinafter Boyd).

Regarding claims 6, 21 and 31, Stevens-Aweya does not specifically disclose establishing a plurality of active direct memory access connections between said host and a plurality of specified memory locations of a plurality of destinations; sending a plurality of messages to specified memory locations of the destinations of the direct memory access connections wherein each message comprises a plurality of data packets; receiving message acknowledgments, each message acknowledgment being sent by a destination for each message received by the destination; and establishing a plurality of message limits, each message limit imposing a separate limit for each direct memory access connection on the quantity of messages sent from said host to the specified memory location of the direct memory access connection associated with the message limit and lacking a message acknowledgment of being received by the destination of the direct memory access connection associated with the message limit.

However, Boyd discloses an RDMA work request to read a virtually contiguous memory space on a remote node [Boyd, paragraph 76 and figure 19, multiple hosts, multiple destinations].

It would have been obvious to one having ordinary skill in the art at the time the invention was made to incorporate RDMA to remote destinations in order to allow data to move directly form the memory of one computer to that of another computer without involving the operating system.

Boyd further discloses, sending a plurality of messages to specified memory locations of the destinations of the direct memory access connections wherein each message comprises a plurality of data packets [Boyd, paragraph 122];

receiving message acknowledgments, each message acknowledgment being sent by a destination for each message received by the destination [Boyd, paragraph 122]; and establishing a plurality of message limits, each message limit imposing a separate limit for each direct memory access connection on the quantity of messages sent from said host to the specified memory location of the direct memory access connection associated with the message limit and lacking a message acknowledgment of being received by the destination of the direct memory access connection associated with the message limit [Boyd, paragraph 122].

Regarding claims 7, 22 and 32, Stevens-Aweya-Boyd further discloses each direct memory access connection includes a network interface between an application of said host and a network connecting the host to the plurality of destinations and wherein said network interface includes a queue for each direct memory access connection and adapted to queue messages to be sent through the direct memory access connection associated with each queue [Boyd, paragraph 122], and wherein said each sending of a message to specified memory location of the destination of a direct memory access connection includes queuing the message in the network interface queue associated with the direct memory access connection [Boyd, paragraphs 122 and 69-74]; and

wherein the queuing of messages in the network interface queue associated with a direct memory access connection is suspended when the quantity of messages sent from said host to the specified memory location of the associated direct memory access connection and lacking a message acknowledgment of being received by the destination of the associated direct memory access Connection reaches the separate message limit imposed on the direct memory access connection associated with the network interface queue [Boyd, paragraphs 122 and 69-74].

Regarding claims 8, 23 and 33, Stevens-Aweya-Boyd further discloses the queuing of messages in the network interface queue associated with a direct memory access connection is resumed when the quantity of messages sent from said host to the specified memory location of the associated direct memory access connection and lacking a message acknowledgment of being received by the destination of the associated direct memory access connection is less than the separate message limit imposed on the direct memory access connection associated with the network interface queue [Boyd, paragraph 122].

Regarding claims 9, 24 and 34, Stevens-Aweya-Boyd further discloses the packet sending connection is a Transmission Control Protocol connection between the host and the destination and wherein each direct memory access connection is a Remote Direct Memory Access connection between the host and the destination of the direct memory access connection [Boyd, paragraph 7].

Regarding claims 10, 25 and 35, Stevens-Aweya-Boyd further discloses said network interface has a pool of empty messages which imposes a limit on the total quantity of messages sent from said host to all the specified memory locations of all the direct memory access connections and lacking a message acknowledgment of being received by the destination of the associated direct memory access connection and wherein each message limit is less than the network interface pool of empty messages [Boyd, paragraphs 119-122].

Regarding claims 11 and 36, Stevens-Aweya-Boyd further discloses each message limit is based, at least in par, on the number of active direct memory access connections of the host [Boyd, paragraphs 119-122].

Regarding claims 12 and 37, Stevens-Aweya-Boyd further discloses changing the size of a message limit of an active direct memory access connection prior to sending at least one message through the associated direct memory access connection [Boyd, paragraphs 119-123].

Regarding claims 13 and 38, Stevens-Aweya-Boyd further discloses each message limit is based, at least in par, on the number of active direct memory access connections of the host [Boyd, paragraphs 119-122].

Response to Arguments

4. Applicant's arguments with respect to claims 1-39 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Examiner's Note: Examiner has cited particular paragraphs / columns and line numbers in the reference(s) applied to the claims above for the convenience of the applicant.

Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the cited passages as taught by the prior art or relied upon by the examiner.

Should applicant amend the claims of the claimed invention, it is respectfully requested that applicant clearly indicate the portion(s) of applicant's specification that support the amended claim language for ascertaining the metes and bounds of applicant's claimed invention

Any inquiry concerning this communication or earlier communications from the examiner should be directed to WILLIAM J. GOODCHILD whose telephone number is

Application/Control Number: 10/663,026 Page 12

Art Unit: 2445

(571)270-1589. The examiner can normally be reached on Monday - Friday / 8:00 AM - 4:00 PM EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glenton Burgess can be reached on (571) 272-3949. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
